

Stolac

From Vidiškale, Rab towards Velebit, at about 1000 meters, there is a shallow spot in the open sea called Stolac.

The wall starts at 6 to 7 meters and descends down to 60 meters of depth. Besides the numerous cuttings,

small caves, shelves and canyons you can see red gorgonians, crabs, scorpionfish, the common dentex and numerous other smaller and bigger fish in different colours.

Very often you can come across mackerel schools.

Mala plaža

This is a very nice post ranging from 5 to 45 meters of depth. It is characterized by a cave at 27 to 30 meters of depth entering the island 30 meters in length.

During the dive, among other, you can see gorgonians, scorpion fish, two-banded sea breams, congers and other.

Lastavice

At Lastavice, the wall starts at 5 to 6 meters and falls down to 40 meters. At this post there are quite a few white lace-like gorgonians intertwined with red gorgonians ranging up to 1 meter in size. This post represents a good opportunity for picture taking.
